

# Single-Channel 1206-8 ChipFET® Power MOSFET Recommended Pad Pattern and Thermal Performance

## INTRODUCTION

New Vishay Siliconix ChipFETs in the leadless 1206-8 package feature the same outline as popular 1206-8 resistors and capacitors but provide all the performance of true power semiconductor devices. The 1206-8 ChipFET has the same footprint as the body of the LITTLE FOOT® TSOP-6, and can be thought of as a leadless TSOP-6 for purposes of visualizing board area, but its thermal performance bears comparison with the much larger SO-8.

This technical note discusses the single-channel ChipFET 1206-8 pin-out, package outline, pad patterns, evaluation board layout, and thermal performance.

## PIN-OUT

Figure 1 shows the pin-out description and Pin 1 identification for the single-channel 1206-8 ChipFET device. The pin-out is similar to the TSOP-6 configuration, with two additional drain pins to enhance power dissipation and thermal performance. The legs of the device are very short, again helping to reduce the thermal path to the external heatsink/pcb and allowing a larger die to be fitted in the device if necessary.

FIGURE 1.

For package dimensions see the 1206-8 ChipFET package outline drawing (<http://www.vishay.com/doc?71151>).

## BASIC PAD PATTERNS

The basic pad layout with dimensions is shown in Application Note 826, *Recommended Minimum Pad Patterns With Outline Drawing Access for Vishay Siliconix MOSFETs*, (<http://www.vishay.com/doc?72286>). This is sufficient for low power dissipation MOSFET applications, but power semiconductor performance requires a greater copper pad area, particularly for the drain leads.

FIGURE 2. Footprint With Copper Spreading

The pad pattern with copper spreading shown in Figure 2 improves the thermal area of the drain connections (pins 1,2,3,6,7,8) while remaining within the confines of the basic footprint. The drain copper area is 0.0054 sq. in. or 3.51 sq. mm). This will assist the power dissipation path away from the device (through the copper leadframe) and into the board and exterior chassis (if applicable) for the single device. The addition of a further copper area and/or the addition of vias to other board layers will enhance the performance still further. An example of this method is implemented on the Vishay Siliconix Evaluation Board described in the next section (Figure 3).

## THE VISHAY SILICONIX EVALUATION BOARD FOR THE SINGLE 1206-8

The ChipFET 1206-08 evaluation board measures 0.6 in by 0.5 in. Its copper pad pattern consists of an increased pad area around the six drain leads on the top-side—approximately 0.0482 sq. in. 31.1 sq. mm—and vias added through to the underside of the board, again with a maximized copper pad area of approximately the board-size dimensions. The outer package outline is for the 8-pin DIP, which will allow test sockets to be used to assist in testing.

The thermal performance of the 1206-8 on this board has been measured with the results following on the next page. The testing included comparison with the minimum recommended footprint on the evaluation board-size pcb and the industry standard one-inch square FR4 pcb with copper on both sides of the board.

## THERMAL PERFORMANCE

### Junction-to-Foot Thermal Resistance (the Package Performance)

Thermal performance for the 1206-8 ChipFET measured as junction-to-foot thermal resistance is 15°C/W typical, 20°C/W maximum for the single device. The “foot” is the drain lead of the device as it connects with the body. This is identical to the SO-8 package  $R_{\theta jf}$  performance, a feat made possible by shortening the leads to the point where they become only a small part of the total footprint area.

### Junction-to-Ambient Thermal Resistance (dependent on pcb size)

The typical  $R_{\theta ja}$  for the single-channel 1206-8 ChipFET is 80°C/W steady state, compared with 68°C/W for the SO-8. Maximum ratings are 95°C/W for the 1206-8 versus 80°C/W for the SO-8.

### Testing

To aid comparison further, Figure 4 illustrates ChipFET 1206-8 thermal performance on two different board sizes and three different pad patterns. The results display the thermal performance out to steady state and produce a graphic account of how an increased copper pad area for the drain connections can enhance thermal performance. The measured steady state values of  $R_{\theta ja}$  for the single 1206-8 ChipFET are :

1) Minimum recommended pad pattern (see Figure 2) on the evaluation board size of 0.5 in x 0.6 in.	156°C/W
2) The evaluation board with the pad pattern described on Figure 3.	111°C/W
3) Industry standard 1" square pcb with maximum copper both sides.	78°C/W

The results show that a major reduction can be made in the thermal resistance by increasing the copper drain area. In this example, a 45°C/W reduction was achieved without having to increase the size of the board. If increasing board size is an option, a further 33°C/W reduction was obtained by maximizing the copper from the drain on the larger 1" square pcb.

## SUMMARY

The thermal results for the single-channel 1206-8 ChipFET package display similar power dissipation performance to the SO-8 with a footprint reduction of 80%. Careful design of the package has allowed for this performance to be achieved. The short leads allow the die size to be maximized and thermal resistance to be reduced within the confines of the TSOP-6 body size.
